Systemware Innovation enhances equipment status monitoring application to automate temporary jumper management process

Toronto, APRIL 30, 2009 – Systemware Innovation (SWI) has successfully completed system enhancements that will allow its client, a major hydro and fossil fuel utility generator in Ontario, to automate its process for temporary jumper management. The existing equipment status monitoring application was modified in response to the client's need for a more efficient and reliable process for handling temporary changes/alterations to plant equipment. The new system enhancements allow the client to effectively manage the process by introducing workflow automation, centralized data storage, query capabilities, audit logging and reporting functionality.

"From the project requirements through to the deployment we are very pleased with the excellent work of our staff," commented VP Strategic Projects Jim Picha. "We value the long and successful relationship that we have had with this client and I think being able to deliver a solution that meets their immediate and long-term needs is key."

SWI's responsibilities on this project required proficiency in a number of areas, including business analysis and requirements specification, software design, integration, implementation, verification, user and technical documentation, and overall project management.

"We have extensive experience in developing equipment status monitoring applications and delivering fully managed turnkey solutions," remarked CEO David Tremaine. "Projects like this allow us to leverage that expertise to provide superior performance and service to our client."

SWI has been providing technology solutions to the energy sector since 1980. During this time, SWI has been a key contributor to the success of numerous projects within the energy market. SWI consultants work both as attached staff, complementing the clients' project teams, and on solutions managed at SWI facilities.
