## MEDIA RELEASE

### Systemware Innovation deploys SWI Issue Management System for a petroleum industry leader

**Toronto, October 31, 2008** – Systemware Innovation (SWI) has successfully delivered its SWI Issue Management System (SIMS™) as a stand-alone application for an Alberta petroleum industry leader. SIMS™ is being used within the process operation of this petroleum industry leader by allowing for the real-time logging, disposition, and signoff of issues in a dedicated, secure environment.

“We have a very deep understanding of the energy sector,” remarked CEO David Tremaine. “We appreciate the opportunity to apply our knowledge to different facets of the industry. Projects like this allow us to leverage our expertise to provide superior performance and service to our customers.”

In this deployment, the customer had restrictions on using an externally hosted solution, so SWI provided them a version of SIMS™ to run in their own local access network. “In common with many companies running complex process facilities, restricting outside LAN access is a key security consideration for this customer,” commented Steve Monier-Williams, Business Development Manager. “Our flexibility in deploying SIMS™ as a site resident application was key to meeting their needs.”

SWI typically delivers SIMS™ as a hosted, software-as-a-service (SaaS) solution for numerous process and energy industry customers. This allows them to use the full functionality of the system without having to be responsible for its upkeep. These deployments are usually in the context of large projects where SWI is providing consulting services.

SWI has been providing technology solutions to the energy sector since 1980. During this time, SWI personnel have been key contributors to the success of numerous projects within the petroleum industry. SWI project teams work both in support of customers who choose to implement in-house and on solutions managed at SWI facilities and delivered on a turnkey basis.
