MEDIA RELEASE

Systemware Innovation deploys Work Protection documentation system in Newfoundland thermal power plant

Toronto, September 30, 2008 – Systemware Innovation (SWI) is proud to announce that it has deployed a Work Protection documentation system to a thermal power generation station in Newfoundland. Building on its experience deploying a similar system in a number of facilities in Ontario, SWI was able to complete the project in time for the new system to be used in a pre-scheduled maintenance outage.

“We’ve gained some valuable experience in electronic Work Protection systems through our past projects in this area,” commented Jeff McDougall, VP Professional Services. “In this case, our familiarity with the work processes allowed us to quickly implement the system and train the plant personnel on its use.”

The deployed system provides an effective, efficient, consistent, and standard means of creating Work Protection documentation. Standardization of equipment nomenclature and operations can help in preventing operating errors, which increases personnel and public safety as well as plant availability. The system also promotes efficiency by providing guidance to the plant’s work protection governance and consolidating common work protection activities in one area.

“I am very pleased with the high level of acceptance this solution has received from the plant’s staff. Our user representatives report that staff are adapting quickly to the system, and are seeing immediate efficiency gains,” remarked Project Manager Andrew Brewer.

SWI has been providing technology solutions to the energy sector since 1980. During this time, SWI has been a key contributor to the success of numerous major energy industry projects. SWI consultants work both as attached staff, complementing the clients’ project teams, and on solutions managed at SWI facilities.
